

HIFU

High Intensity Focussed Ultrasound

Skin Tightening

Wrinkle Reduction

Facial Contouring

With two of the most effective and sought-after non-invasive treatment technologies combined in one device, Focus Dual will set your clinic apart and give you a competitive edge. Combining Radio Frequency, Microneedling & High Intensity Focused Ultrasound (HIFU) state-of-the-art technology, Focus Dual lift, firms and tightens the skin for both face & body.

The combination of the two technologies let you build a sophisticated treatment plan for your clients for non-surgical face lifts, scar and stretch mark reduction and rejuvenation of the skin.

TGA Registered (ARTG No. 371470), Focus Dual offers clinically proven technologies for complex face and body treatments.

Benefits:

- Increase in collagen production
- Decrease in wrinkles
- Increase in skin firmness and tightness
- Increase in eye lifting
- Improves jawline definition
- Improves facial contouring
- Increase fat reduction
- For face and body

Focus Dual comes with 3 HIFU cartridges:

- 1.5mm – for superficial skin tightening
- 3mm – for collagen stimulation (if joules are turned higher, this can also do fat melting, i.e for double chin), this cartridge can also be omitted from treatment if a client has significant hollowing.
- 4.5mm – targets the SMAS (this is what surgeons cut and tighten during a deep plane facelift), this gives an instant lift as the HIFU energy tightens muscle fibers.

Three sessions are required initially, each a month apart, followed by a maintenance session recommended two to three times a year. Post treatment, your results should remain evident for at least 12 months before the effects of aging are noticeable again.

Results can be seen as soon as the skin has settled after the first treatment session. The skin should look noticeably healthier, less creased, better hydrated and more supple. With repeated sessions, your skin will look increasingly more radiant and feel firmer.
